RGREEN INVEST takes a minority stake in Quadran International through its INFRAGREEN III fund

RGREEN INVEST, alongside another investor, took an indirect minority stake in Quadran International's platform through its INFRAGREEN III fund. Quadran International is mainly owned by Lucia Holding, which has Jean-Marc Bouchet as its historical shareholder.

This deal is a concrete illustration of INFRAGREEN III's strategy which lies in supporting and accelerating the growth of renewable energy project platforms in Europe.

Renewable energies continue to increase their competitiveness to fossil fuels, thus encouraging the emergence of new deployment opportunities in southern and eastern Europe.

Run by Jean-Marc Bouchet, a recognized player in renewable energies since the creation of JMB Energy and Quadran in the 2000s, Quadran International is committed to follow this dynamic, helped by the financing solutions for the energy transition provided by RGREEN INVEST's funds.

About RGREEN INVEST

RGREEN INVEST, a French asset management company created in 2013 by Nicolas Rochon, is the first French financing platform for green infrastructures, enabling institutional investors to direct their capital towards financing projects related to the energy transition.

Primarily driven by climate issue concern, RGREEN INVEST supports entrepreneurs and project leaders in a long-term relationship, encouraging their progress on environmental, social and governance issues, both on their activity and their value chain. RGREEN INVEST enables institutional investors to participate in the energy transition while sharing the financial performance with them.

With around twenty experienced professionals from the fields of fund management, industry and banking, RGREEN INVEST has one of the largest teams of specialists in the financing of renewable energy production infrastructure projects in France. RGREEN INVEST has raised more than €600 million over the past 5 years and financed projects in France and Europe with an installed capacity of more than 1.5 GW, which enables to avoid around 400,000 tons of CO₂ emissions.
